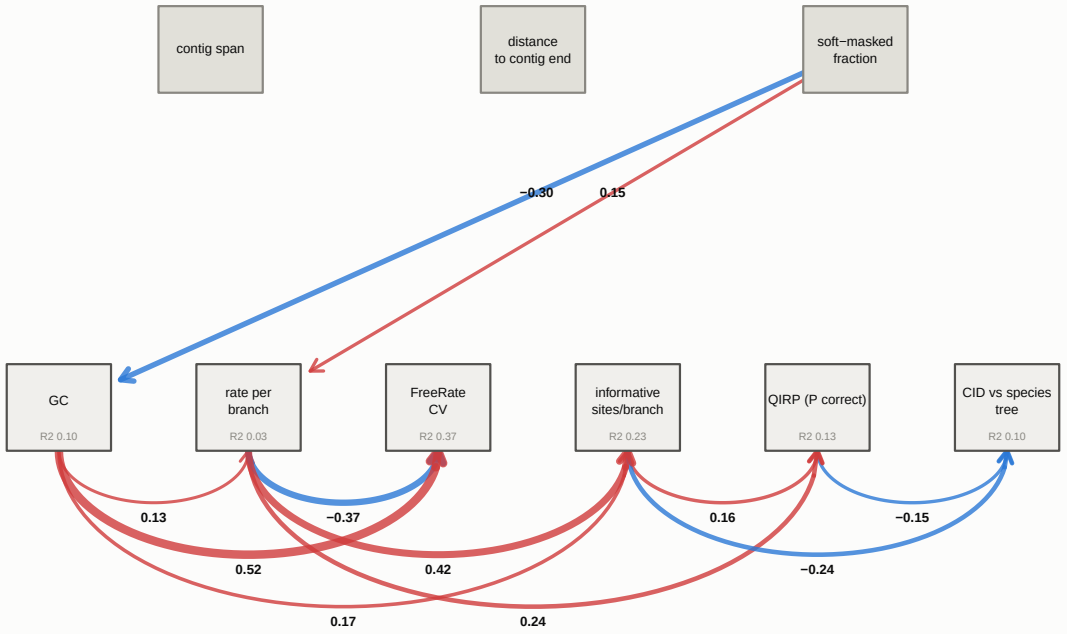
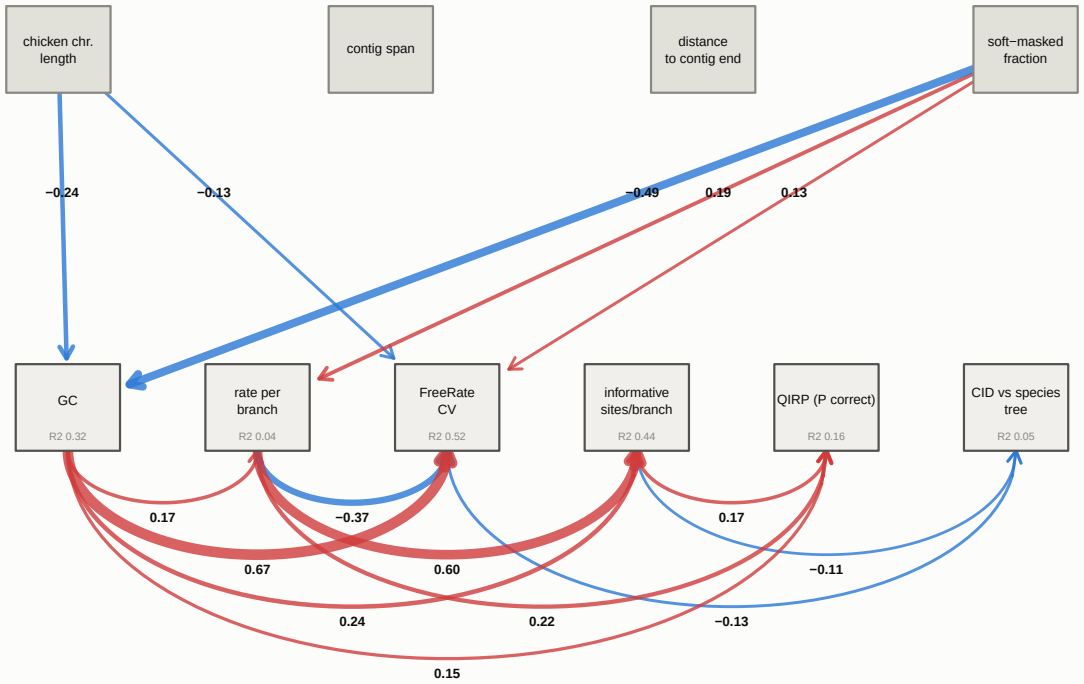
Direct paths |beta| >= 0.1 with a contig−bootstrap 95% interval excluding 0; red +, blue −; width ~ |beta|. Genomic predictors (top row, free to correlate) and hubs in the assumed causal order (left to right).

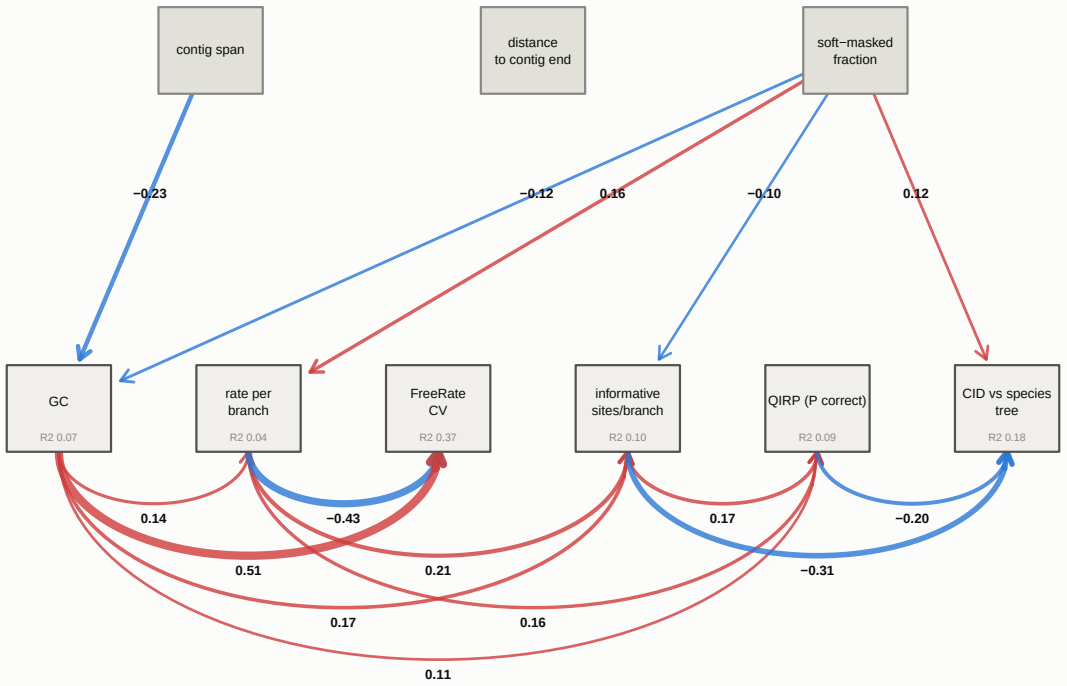
Pooled (4 clades, within clade) (81,929 loci)



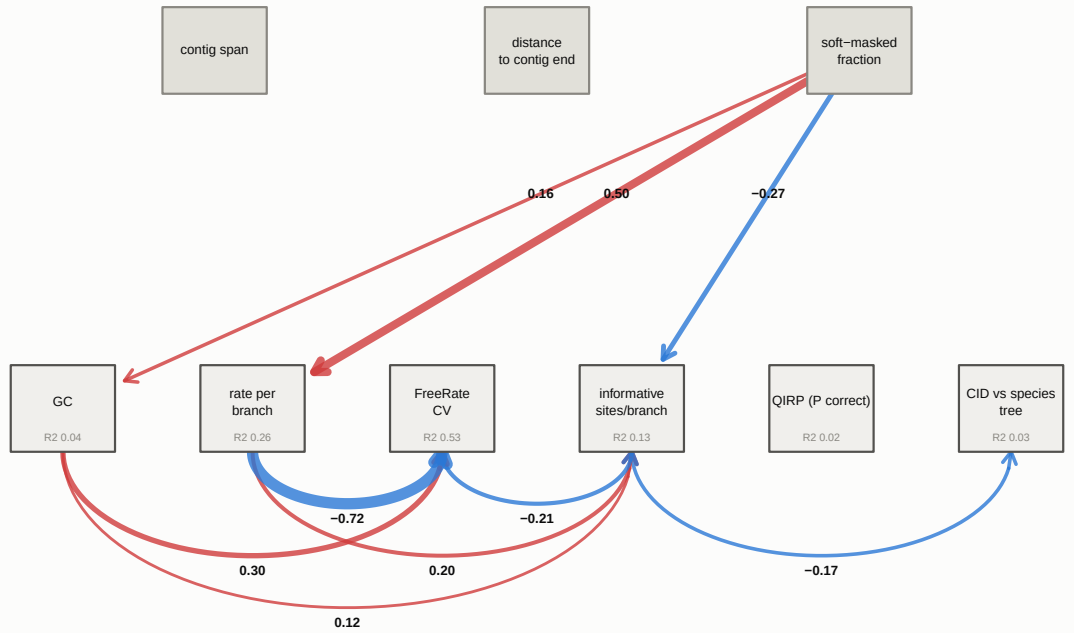
Birds (41,798 loci)



Squamates (24,557 loci)



Cartilaginous fishes (12,207 loci)



All variables within clade and size−free (SD units). Saturated recursive model: a decomposition under the assumed order, not a test of it.
