Metrics disagree about what a good locus looks like, within clade

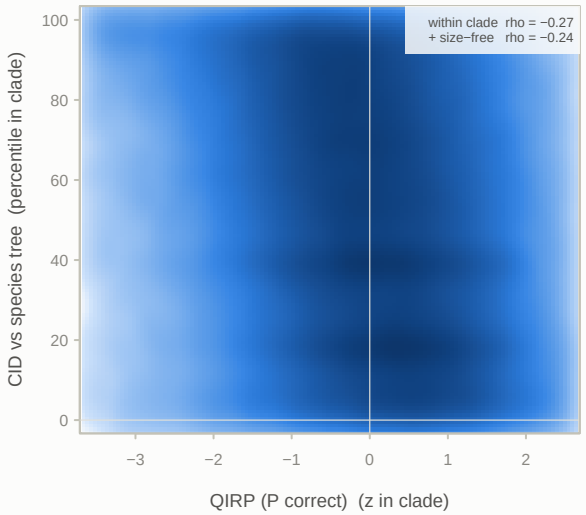

Divergence vs per−site concordance

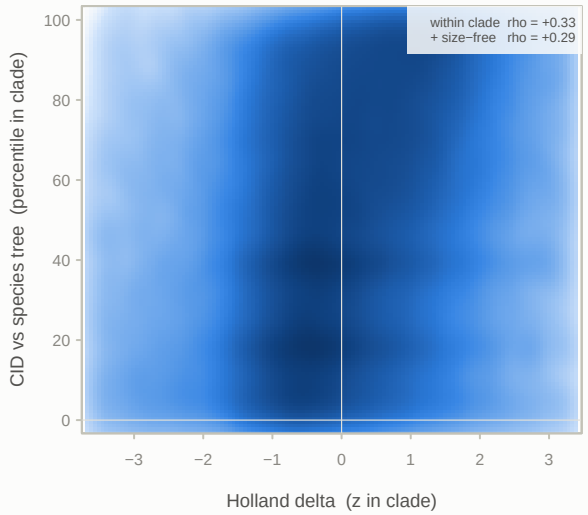

Information vs concordance

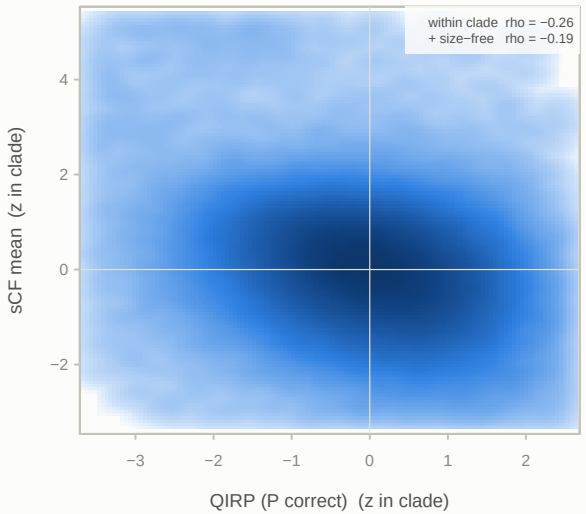

Predicted power vs reference agreement

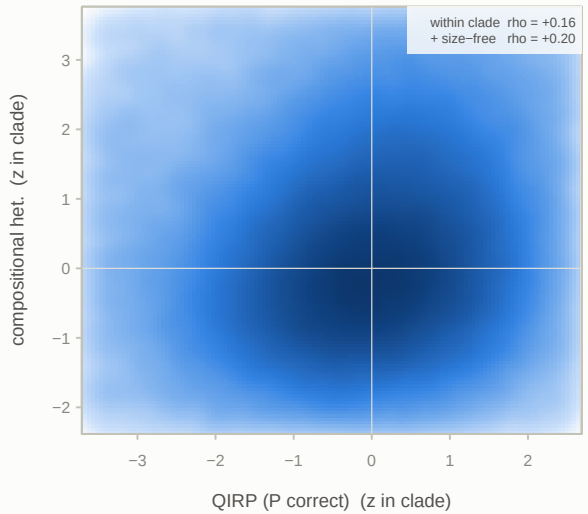

Treelikeness vs reference agreement

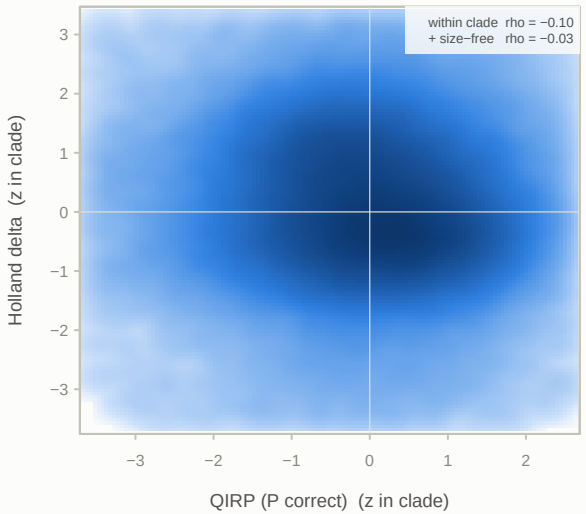

Predicted power vs per−site concordance

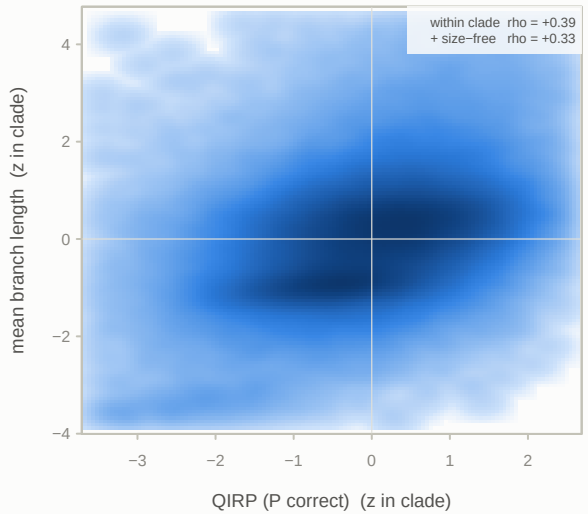

Predicted power vs composition

Predicted power vs reticulation

Predicted power vs divergence

Axes: robust z within clade ((x − median) / MAD), CID as percentile within clade; shading = locus density (n = 112,199), central 99% shown. Size−free rho: rank residual on clade + log tips + log sites. Bottom row: QIRP against four other axes.
